Network Traffic Scans, Malicious Website Protection and Next-Gen Firewall Defense

These elements work together to provide ongoing data protection for email and user web browsing in real time. With AV+ for Smart Support, your network traffic will be continuously scanned for various types of potential security threats.

Omega Systems prevents advanced and sophisticated threats through an adaptive and layered approach at the workstation level. Machine learning technologies are combined with the ability to monitor behavior. The advanced-level attack detection techniques enable us to detect, prevent and block threats that traditional endpoint and "next-gen AV" defenses miss.

Incoming & Outgoing Email traffic (POP3 and SMTP) - When an infected email is discovered, it is automatically replaced with a standardized email message informing the receiver of the original infected message.

Web Traffic (HTTP) - When a website is classified as malicious, it is automatically blocked. A special warning screen is displayed instead to inform the user that the requested website is dangerous.

Firewall - Our next-gen firewall software identifies and protects against port scan attacks that inhibit or disrupt network availability.
