Smart Stor
Cloud Backup & Recovery
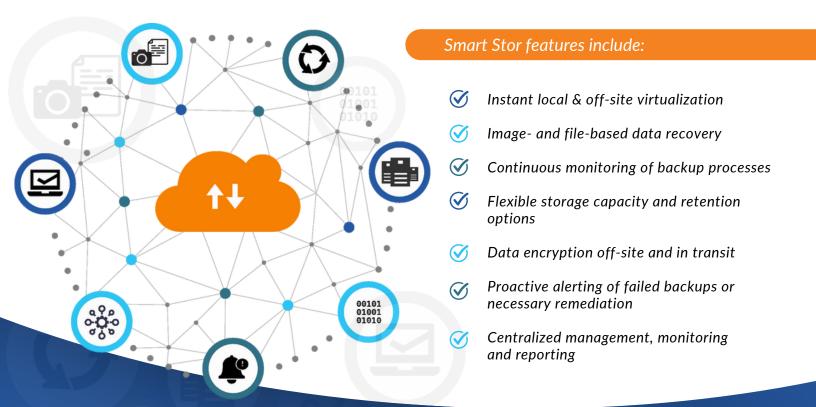

omega systems
technology managed

Protect your business-critical data and recover faster and safer when an unexpected disaster strikes.

Smart Stor, Omega's data backup and recovery service, delivers the protection you need in the face of potential cyber threats, system outages, hardware failures and natural disasters — with the flexibility and simplified management to help you restore operations rapidly.

Smart Stor Features & Benefits

Omega Systems utilizes a hybrid approach to data backup, combining the reliability of a local backup device with the convenience of cloud-based backup to deliver our Smart Stor solution. Image-based technology takes a complete picture of your company's workstations and servers and stores backups locally and at a secure, off-site data center for extra redundancy.

Since each backup is a fully bootable virtual machine, there is no need for complex, time-consuming conversion processes before performing a restore. Data is always available immediately, both on and off-site, for near-instantaneous recovery and virtualization.

Smart Stor features include:

- ✓ *Instant local & off-site virtualization*
- ✓ *Image- and file-based data recovery*
- ✓ *Continuous monitoring of backup processes*
- ✓ *Flexible storage capacity and retention options*
- ✓ *Data encryption off-site and in transit*
- ✓ *Proactive alerting of failed backups or necessary remediation*
- ✓ *Centralized management, monitoring and reporting*

Enable Disaster Recovery & Business Continuity

Data backup is an essential component of your business's disaster recovery and business continuity planning. Whether a disruption occurs due to technology failure, human error or natural disaster, you need the proper recovery solution in place to resume operations rapidly and without data loss.

Omega's Smart Stor is designed with DR and BCP objectives in mind and establishes aggressive Recovery Time Objectives (RTO) to meet your business's goals.

***Intelligent insights**
mean users can track trends over time to see what files have been created, modified or deleted*

***In-transit and off-site encryption**
prevents data viewing, tampering or theft during the entire backup process*

***Ransomware scanning**
technology detects threats before they can compromise your backups*

We'll also work with your teams to facilitate effective disaster recovery testing, so you can assess the quality and effectiveness of your backup and recovery operations and prepare for every possible scenario.

Get Smart about Backup & Recovery

Experience the peace of mind that comes with a managed backup and recovery service from Omega Systems. Our technology professionals can empower your data protection and enable efficient disaster recovery and business continuity with Smart Stor.
